Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Long Tail

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Editorial and hand curated

- List of favorites
- Lists of “essential” items

Simple aggregates

- Top 10, Most Popular, Recent Uploads

Tailored to individual users

- Amazon, Netflix, ...

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

X = set of **Customers**

S = set of **Items**

Utility function $u: X \times S \rightarrow R$

- R = set of ratings
- R is a totally ordered set
- e.g., 0-5 stars, real number in $[0,1]$

Utility Matrix

	Avatar	LOTR	Matrix	Pirates
Alice	1		0.2	
Bob		0.5		0.3
Carol	0.2		1	
David				0.4

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

(1) Gathering “known” ratings for matrix

- How to collect the data in the utility matrix

(2) Extrapolate unknown ratings from the known ones

- Mainly interested in high unknown ratings
 - We are not interested in knowing what you don't like but what you like

(3) Evaluating extrapolation methods

- How to measure success/performance of recommendation methods

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Explicit

- Ask people to rate items
- Doesn't work well in practice – people can't be bothered

Implicit

- Learn ratings from user actions
 - E.g., purchase implies high rating
- What about low ratings?

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Key problem: Utility matrix U is **sparse**

- Most people have not rated most items
- **Cold start:**
 - New items have no ratings
 - New users have no history

Three approaches to recommender systems:

- **1)** Content-based
- **2)** Collaborative
- **3)** Hybrid

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Main idea: Recommend items to customer x similar to previous items rated highly by x

Example:

Movie recommendations

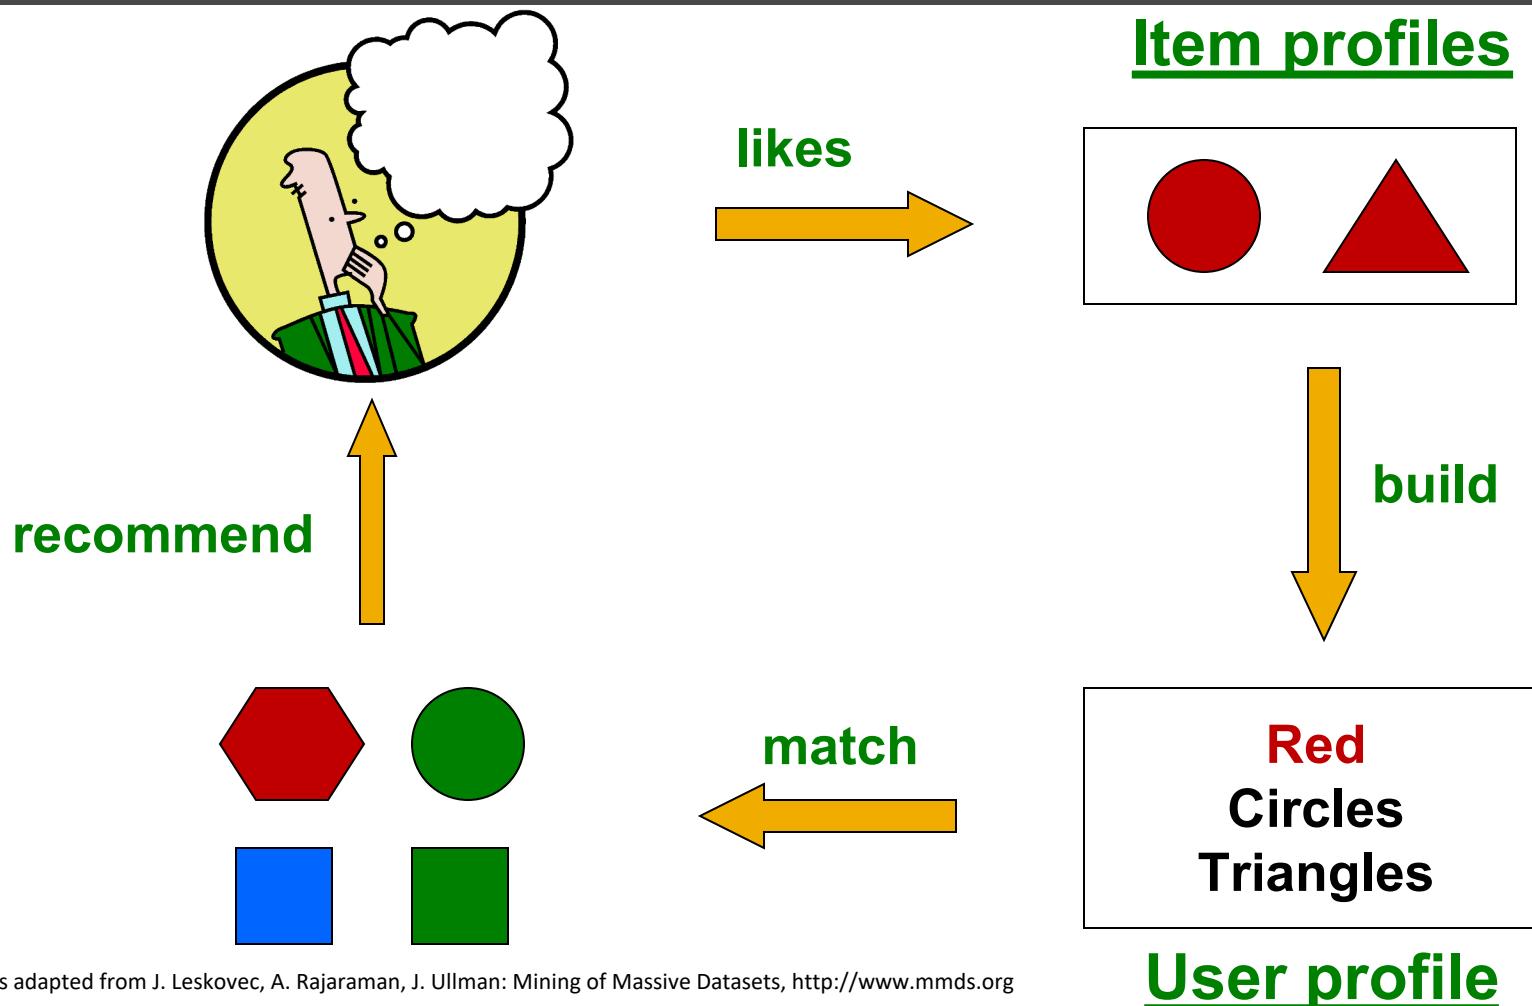

- Recommend movies with same actor(s), director, genre, ...

Websites, blogs, news

- Recommend other sites with “similar” content

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Plan of Action

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

For each item, create an **item profile**

Profile is a set (vector) of features

- **Movies:** author, title, actor, director,...
- **Text:** Set of “important” words in document

How to pick important features?

- Usual heuristic from text mining is **TF-IDF**
(Term frequency * Inverse Doc Frequency)
 - **Term ... Feature**
 - **Document ... Item**

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

- **User profile possibilities:**

- Weighted average of rated item profiles
- **Variation:** weight by difference from average rating for item
- ...

- **Prediction heuristic:**

- Given user profile x and item profile i , estimate

$$u(x, i) = \cos(x, i) = \frac{x \cdot i}{\|x\| \cdot \|i\|}$$

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

+: No need for data on other users

- No cold-start or sparsity problems

+: Able to recommend to users with unique tastes

+: Able to recommend new & unpopular items

- No first-rater problem

+: Able to provide explanations

- Can provide explanations of recommended items by listing content-features that caused an item to be recommended

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

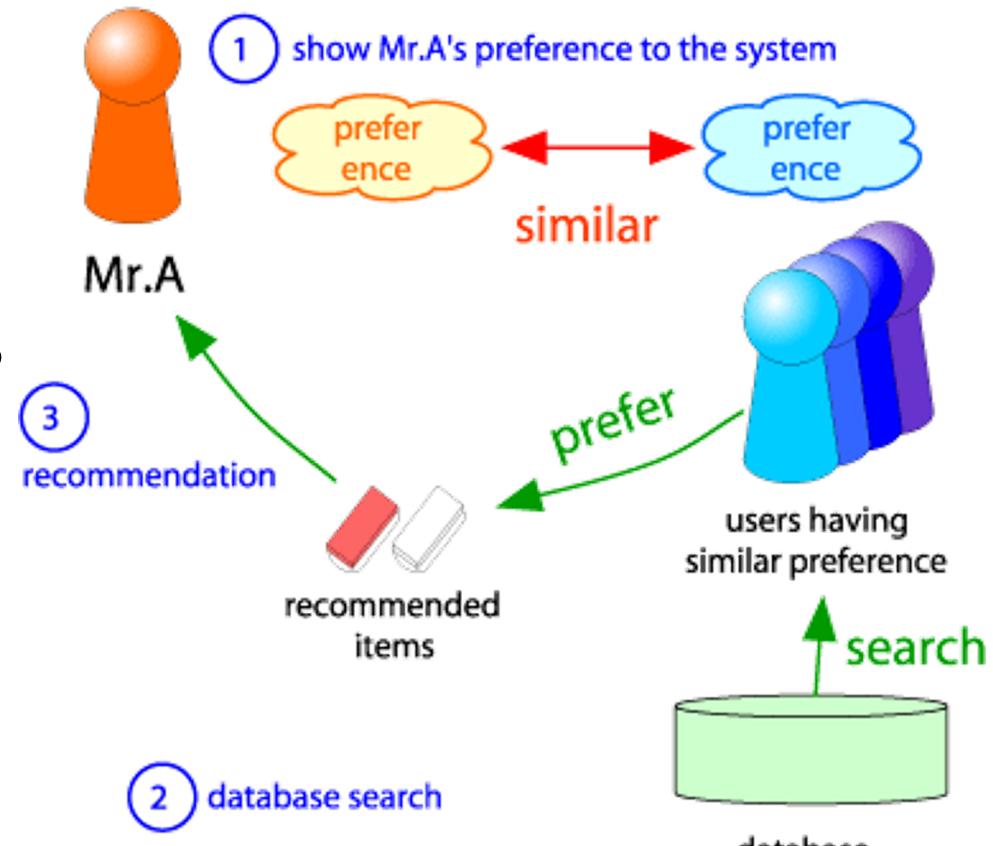

- : Finding the appropriate features is hard**
 - E.g., images, movies, music
- : Recommendations for new users**
 - **How to build a user profile?**
- : Overspecialization**
 - Never recommends items outside user's content profile
 - People might have multiple interests
 - **Unable to exploit quality judgments of other users**

Collaborative Filtering

Consider user x

Find set N of other users whose ratings are “similar” to x 's ratings

Estimate x 's ratings based on ratings of users in N

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

+ Works for any kind of item

- No feature selection needed

- Cold Start:

- Need enough users in the system to find a match

- Sparsity:

- The user/ratings matrix is sparse
- Hard to find users that have rated the same items

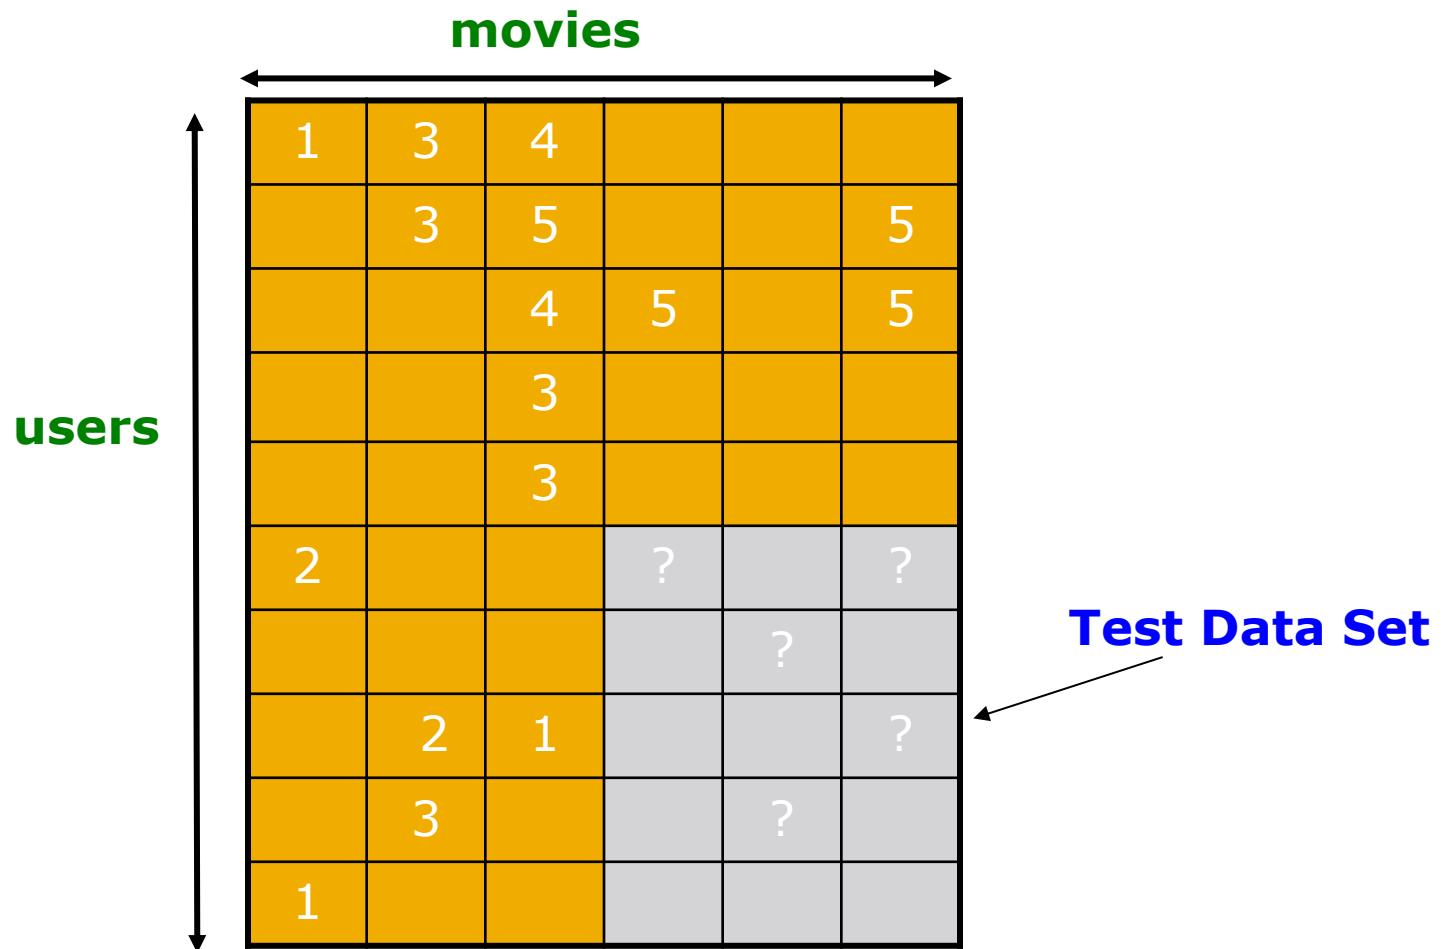

- First rater:

- Cannot recommend an item that has not been previously rated
- New items, Esoteric items

- Popularity bias:

- Cannot recommend items to someone with unique taste
- Tends to recommend popular items

Offline Evaluation

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Predict the rating a user would give to an item

- Root-mean-square error (RMSE)
 - differences between the real and predicted ratings for all items
- Rank Correlation:
 - Spearman's correlation between system and user complete rankings

Recommend a ranked list of (top@k) items

- Precision@k , Recall@k and F_measure@k
- Mean Reciprocal Rank (MRR)
- Normalized Discounted Cumulative Gain (nDGC)

Slides adapted from J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

A/B testing

- Test different algorithms on-the-fly
- Measure #Recommendations followed
- Pros: measure real impact on users
- Cons: only available to data platform owners

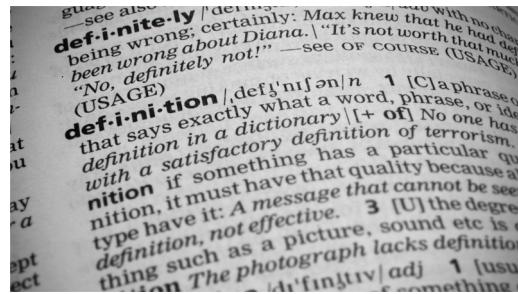

Scientific recommender systems

ABSTRACT In an age of information overload, we are faced with seemingly endless options from which to choose what we want to make for our personal needs, as search engines and online stores. Recommender Systems have long become the key tool for assisting users in their choices. Interestingly, the use of Recommender Systems for recommending scientific items remains a rarity. One difficulty for this is the lack of datasets available with the ratings of the users for books, music, or films. While there are several datasets available with the ratings of the users for books, music, or films, there is a lack of similar datasets for scientific fields, such as Astronomy and Life and Health Sciences. To address this issue, this paper proposes a methodology for generating datasets of implicit feedback for recommending scientific items. The proposed methodology consists in identifying a list of items, finding research articles related to these items, and extracting the names of the authors who wrote these articles. Then, it is possible to associate authors from the collected articles, and the rating values are the number of articles a unique author wrote about an item. Considering that literature is available for every scientific field, the methodology is applied to generate datasets for the fields of Life and Health Sciences and Astronomy. The generated dataset, LIBRETTI (LITERature Based REcommendaTion of scientific Items), was assessed in two distinct study cases, Astronomy and Chemistry. Several evaluation metrics for the datasets generated with LIBRETTI were computed, and the results show that the generated datasets are suitable for the use of recommender algorithms. The results were found to be similar, which provides a solid indication that LIBRETTI is a promising approach for generating datasets of implicit feedback for recommending scientific items.

INDEX TERMS Recommender systems, collaborative filtering, scientific literature dataset, astronomy, chemical compounds.

INTRODUCTION In the last years, scientific literature has increased in size and complexity [1]. Scientific literature has several applications and purposes, but the main goal is to disseminate the work done by researchers. Recommender Systems (RSs) have been a useful help to that end, by improving the discoverability of research articles.

This paper proposes a methodology for generating datasets of implicit feedback, suitable for evaluating recommender algorithms in scientific areas, by going beyond applying a list publications and

Text Mining

Text Mining bridges the gap between natural language (text) and knowledge

Named Entity Recognition

Definition

Task introduced in the MUC-6 evaluation (1995):

«*Named Entity (NE) -- Insert SGML tags into the text to mark each string that represents a person, organization, or location name, or a date or time stamp, or a currency or percentage figure.*» ¹

Another definition (2018):

«*Named Entity Recognition and Classification, an important sub-task of Information Extraction, points to identify and classify members of rigid designators from data suited to different types of named entities such as organizations, persons, locations, etc.*» ²

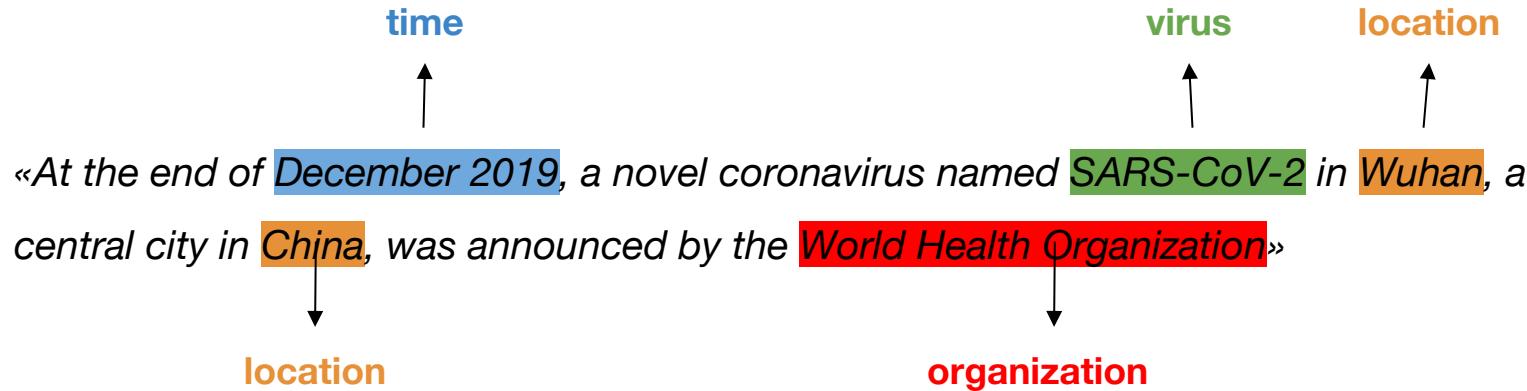

¹B. M. Sundheim, "Overview of results of the MUC-6 evaluation," in *MUC6 '95: Proceedings of the 6th conference on Message understanding*, 1995, pp. 13–31, doi: <https://doi.org/10.3115/1072399.1072402>.

Knowledge Bases

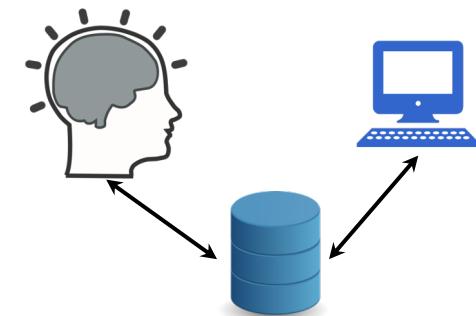

Formal representation of the reality or a part of it, which includes:

- concepts
- definitions
- attributes
- relations between concepts

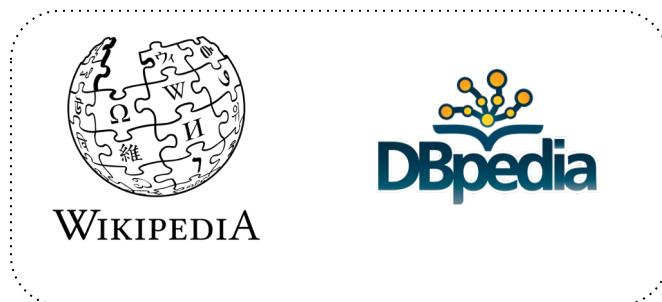

Advantages

- shared understanding of reality/knowledge
- integration of knowledge
- accessible by both computer reasoning and humans

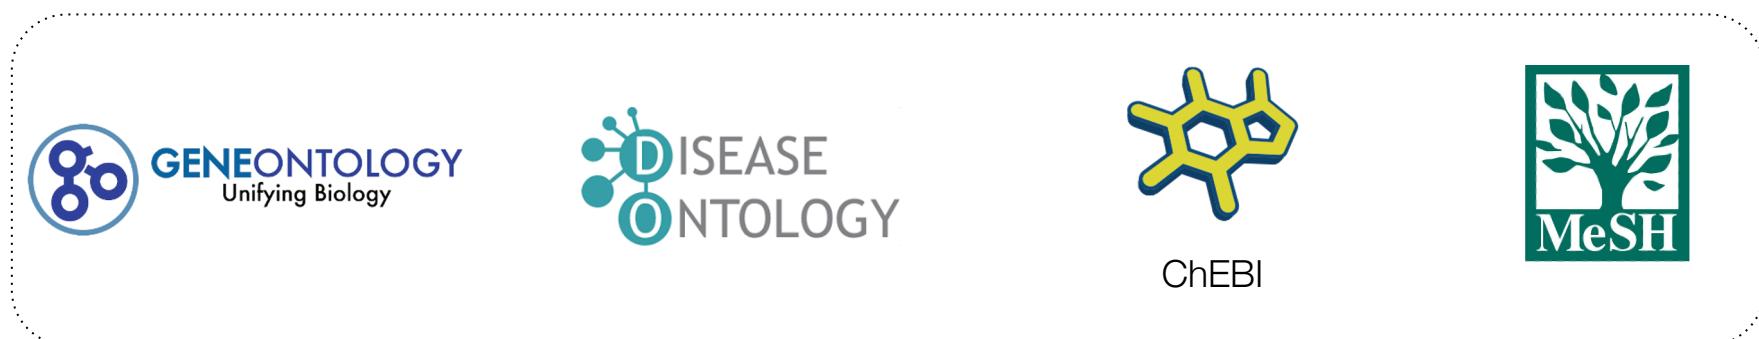

Knowledge Bases

General domain

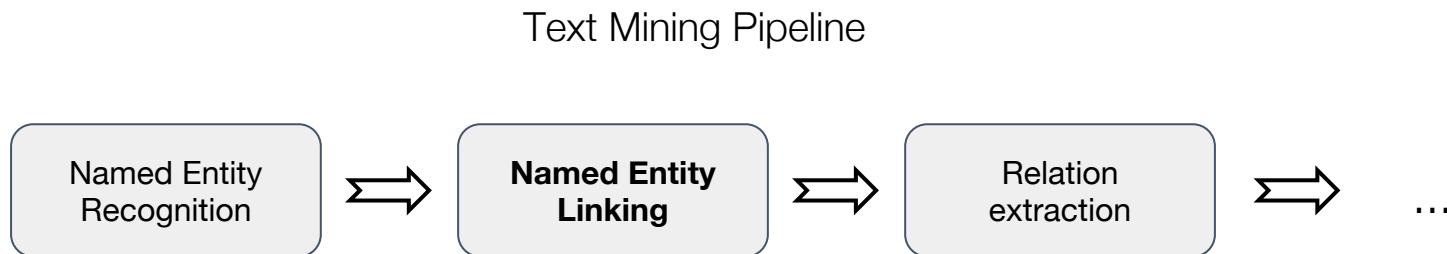

In the biomedical domain

Named Entity Linking (NEL)

Definition

«**Entity Linking**, also referred to as *record linkage* or *entity resolution*, involves aligning a textual mention of a **named-entity** to an appropriate **entry in a knowledge base**, which may or may not contain the entity.»¹

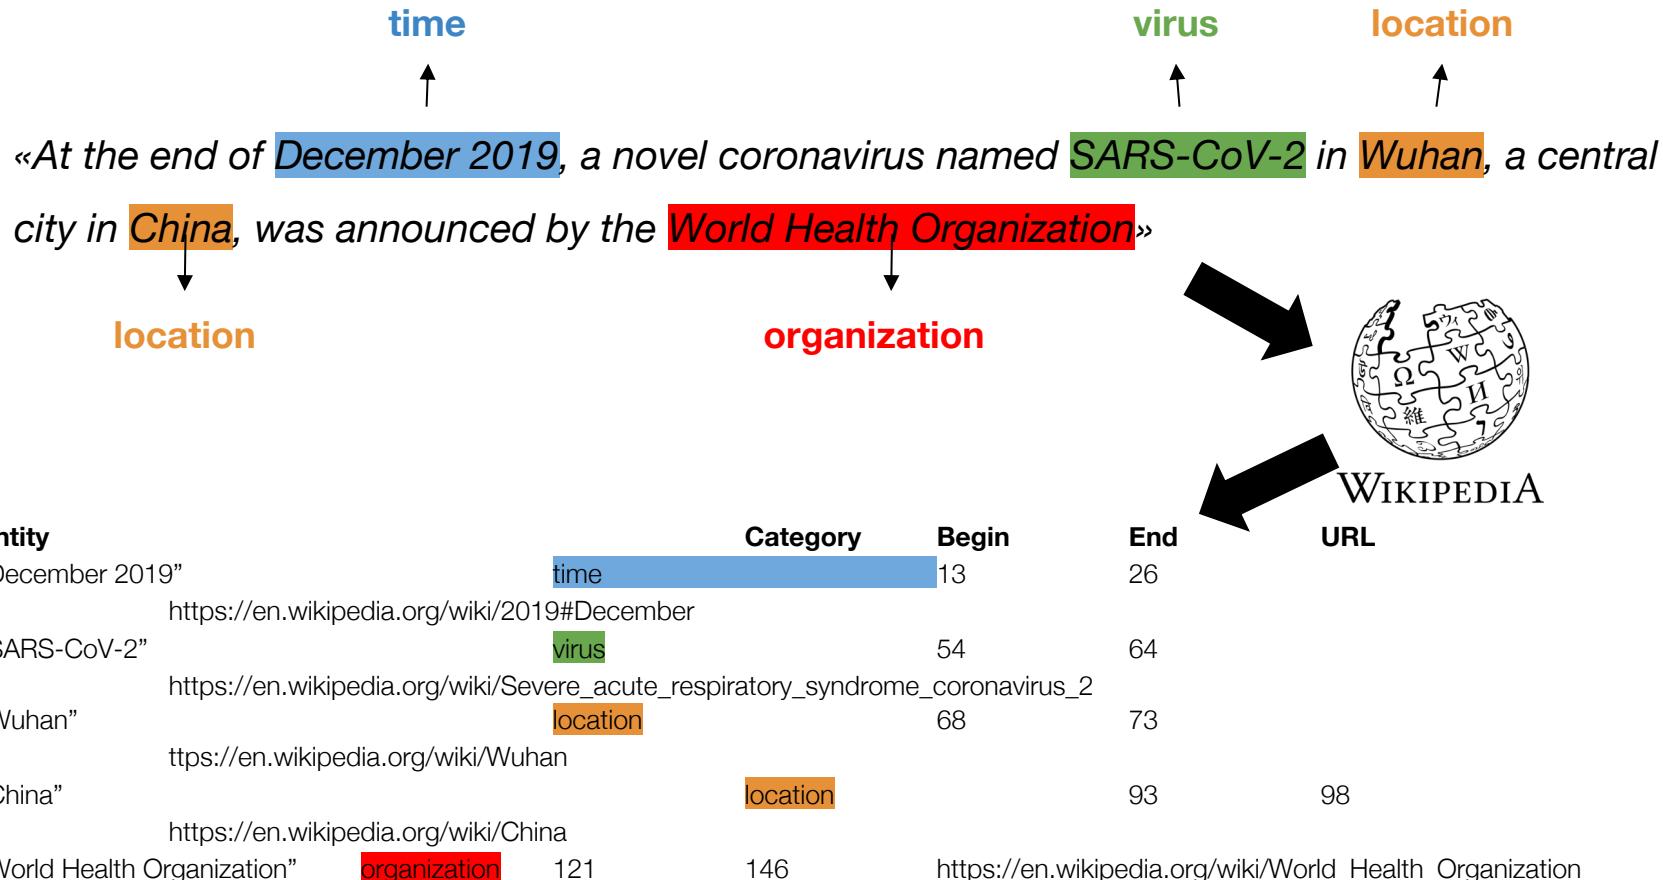

¹D. Rao, P. McNamee, and M. Dredze, "Entity Linking: Finding Extracted Entities in a Knowledge Base," in *Multi-source, Multilingual Information Extraction and Summarization. Theory and Applications of Natural Language Processing.*, P. J. Poibeau T., Saggion H., Ed. Springer, Berlin, Heidelberg, 2013, pp. 93–115.

Named Entity Linking (NEL)

Definition

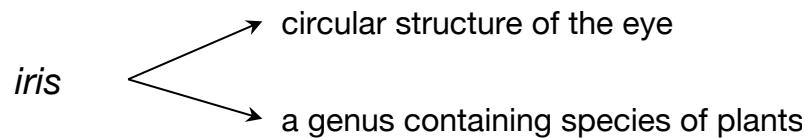

Example

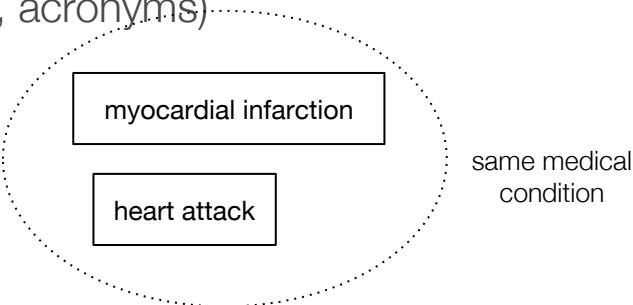

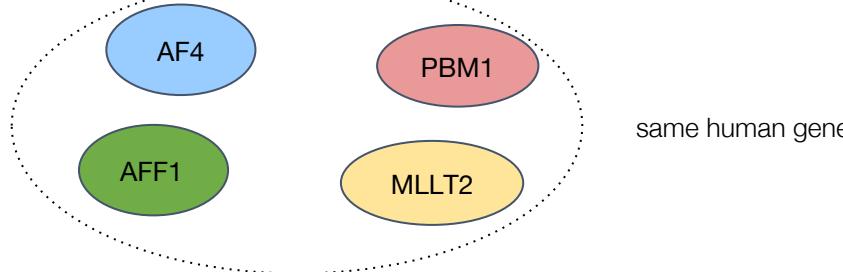

Named Entity Linking (NEL)

Challenges

- **Ambiguity**

- **Entity name variations** (abbreviations, synonyms, acronyms)

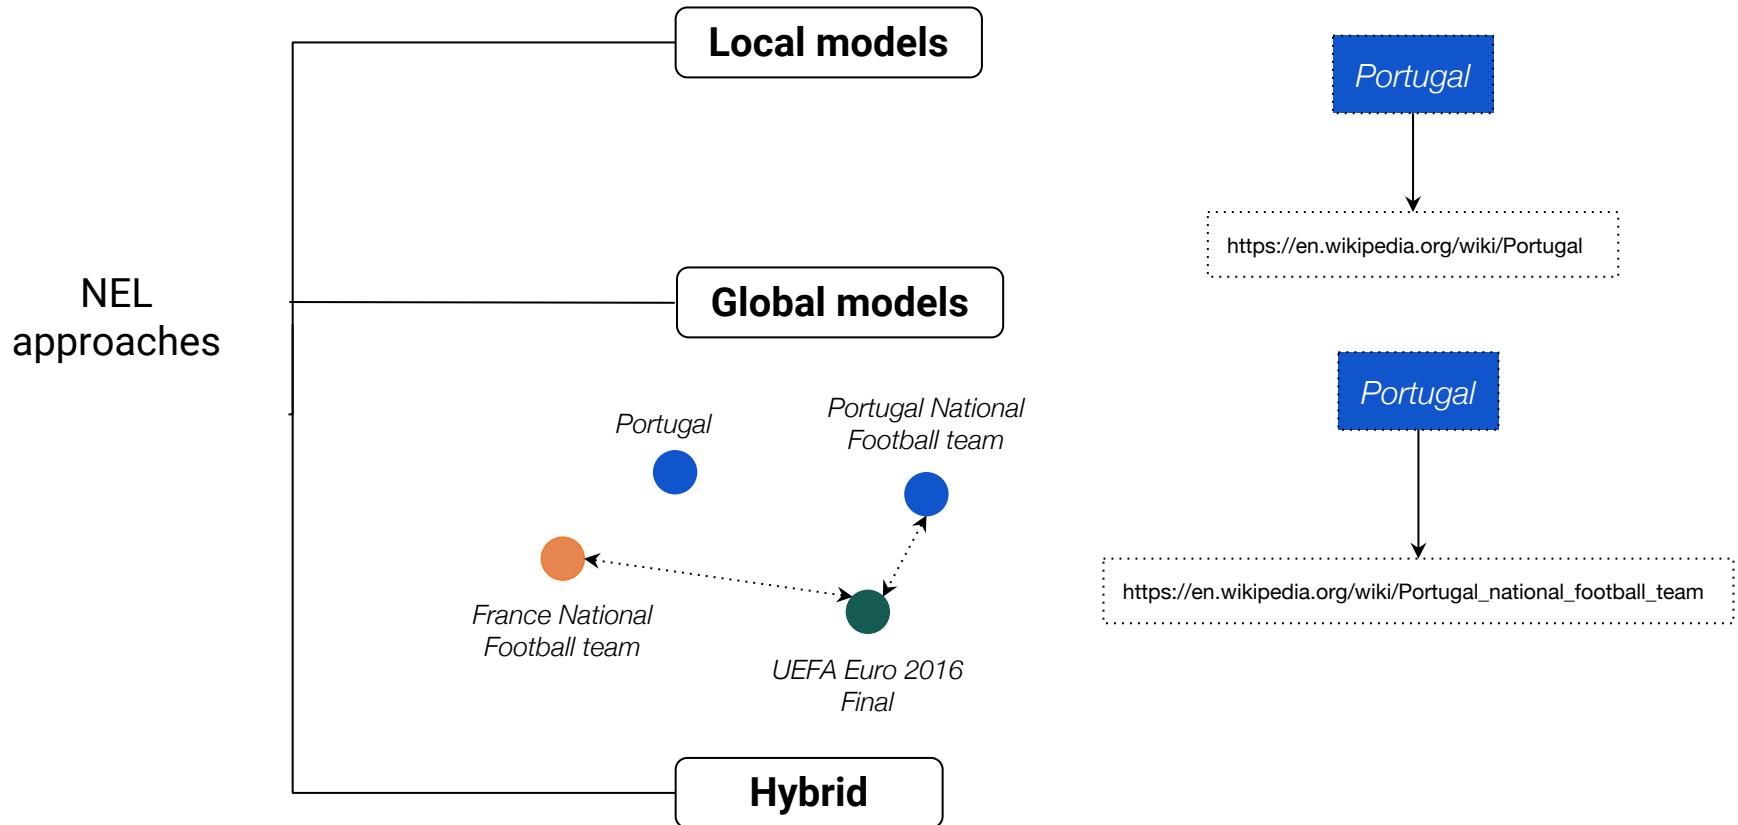

- **Incomplete ontologies/KBs**

Named Entity Linking (NEL)

Types of systems

«Portugal defeated France 1–0 at UEFA Euro 2016 Final»

NER + NEL + Recommender systems

What is the role of Text Mining in Recommender systems?

«(...) text mining techniques can be exploited for the development of recommender systems (...) can be applied to detect user preferences (**user profiling**) and also to **extract context data.**»¹

ABSTRACT

Background: Acetaminophen [paracetamol] is one of the most common medications used for management of pain in the world. There is lack of consensus about the mechanism of action, and concern about the possibility of adverse effects on reproductive health.

Methods: We first established the metabolome profile that characterizes use of acetaminophen, and we subsequently trained and tested a model that identified metabolomic differences across samples from 455 individuals with and without acetaminophen use. We validated the findings in a European ancestry adult twin cohort of 1880 individuals (TwinsUK), and in a study of 1235 individuals of African American and Hispanic ancestry. We used genomics to elucidate the mechanisms targeted by acetaminophen.

Findings: We identified a distinctive pattern of depletion of sulfated sex hormones with use of acetaminophen across all populations. We used a Mendelian randomization approach to characterize the role of Sulfotransferase Family 2A Member 1 (SULT2A1) as the site of the interaction. Although CYP3A7-CYP3A51P variants also modified levels of some sulfated sex hormones, only acetaminophen use phenocopied the effect of genetic variants of SULT2A1. Overall, acetaminophen use, age, gender and SULT2A1 and CYP3A7-CYP3A51P genetic variants are key determinants of variation in levels of sulfated sex hormones in blood. The effect of taking acetaminophen on sulfated sex hormones was roughly equivalent to the effect of 35 years of aging.

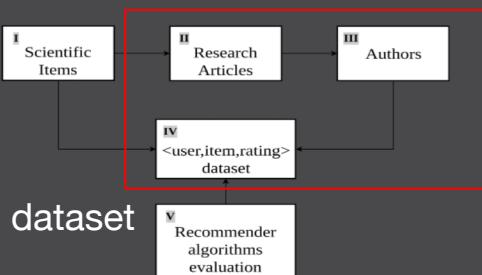

Interpretation: These findings raise concerns of the impact of acetaminophen use on hormonal homeostasis. In addition, it modifies views on the mechanism of action of acetaminophen in pain management as sulfated sex hormones can function as neurosteroids and modify nociceptive thresholds.

ABSTRACT

Background: Acetaminophen (paracetamol) is one of the most common medications used for management of pain in the world. There is lack of consensus about the mechanism of action, and concern about the possibility of adverse effects on reproductive health.

Methods: We first established the metabolome profile that characterizes use of acetaminophen, and we subsequently trained and tested a model that identified metabolic differences across samples from 455 individuals with and without acetaminophen use. We validated the findings in a European ancestry adult twin cohort of 1880 individuals (TwinsUK), and in a study of 1235 individuals of African American and Hispanic ancestry. We used genomics to elucidate the mechanisms targeted by acetaminophen.

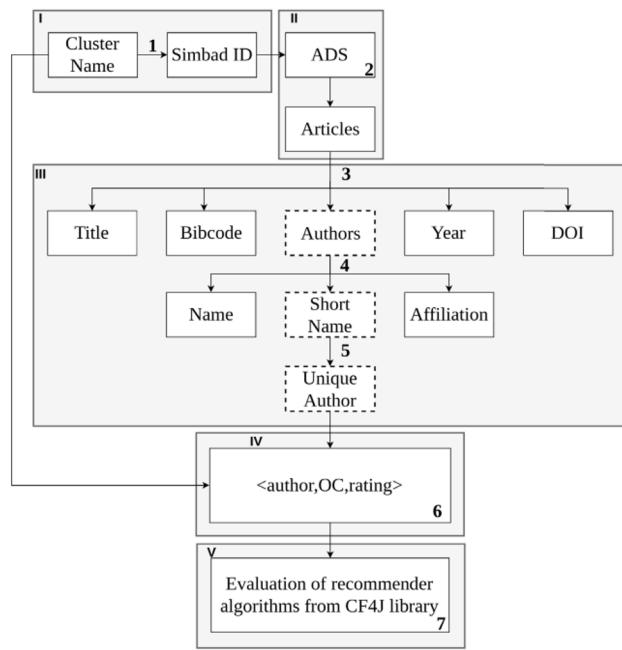

Findings: We identified a distinctive pattern of depletion of sulfated sex hormones with use of acetaminophen across all populations. We used a Mendelian randomization approach to characterize the role of Sulfotransferase Family 2A Member 1 (SULT2A1) as the site of the interaction. Although CYP3A7-CYP3A51P variants also modified levels of some sulfated sex hormones, only acetaminophen use phenocopied the effect of genetic variants of SULT2A1. Overall, acetaminophen use, age, gender and SULT2A1 and CYP3A7-CYP3A51P genetic variants are key determinants of variation in levels of sulfated sex hormones in blood. The effect of taking acetaminophen on sulfated sex hormones was roughly equivalent to the effect of 35 years of aging.

Interpretation: These findings raise concerns of the impact of acetaminophen use on hormonal homeostasis. In addition, it modifies views on the mechanism of action of acetaminophen in pain management as sulfated sex hormones can function as neurosteroids and modify nociceptive thresholds.

CORD-19 dataset

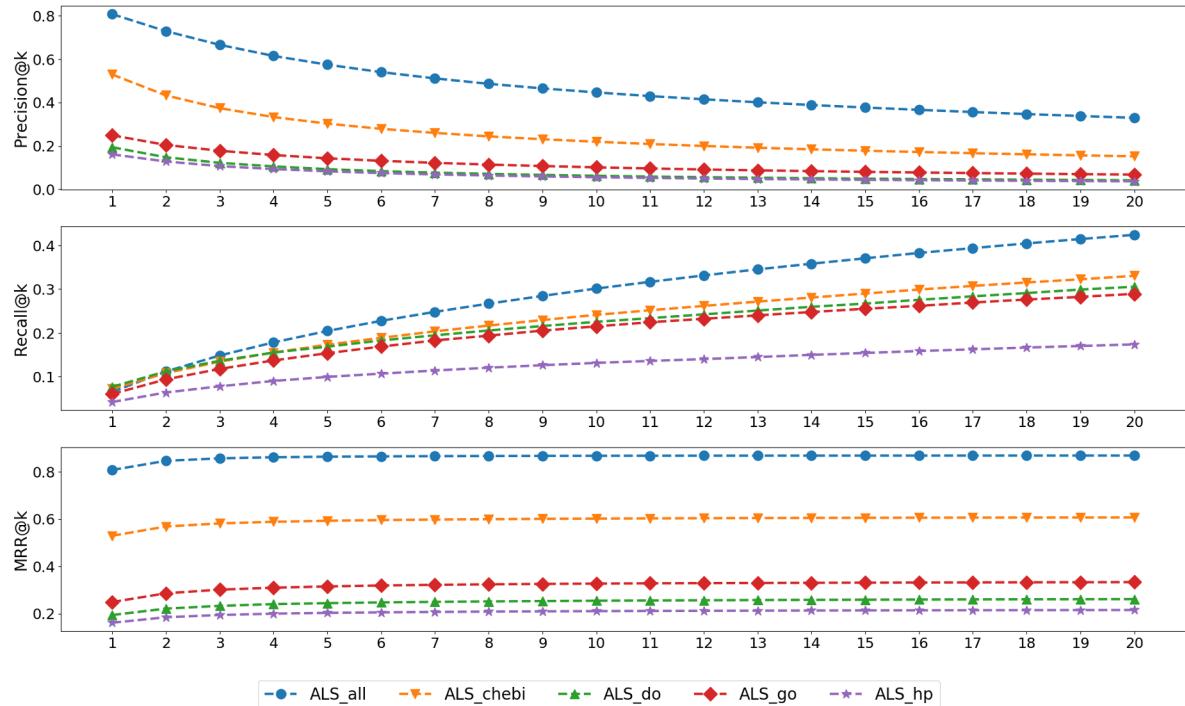

Items from multi scientific fields

Recommendation dataset

Barros, M. A., Lamurias, A., Sousa, D. F., Ruas, P., & Couto, F. M. (2020). COVID-19: A Semantic-Based Pipeline for Recommending Biomedical Entities. Proceedings of the 1st Workshop on NLP for COVID-19 (Part 2) at EMNLP 2020

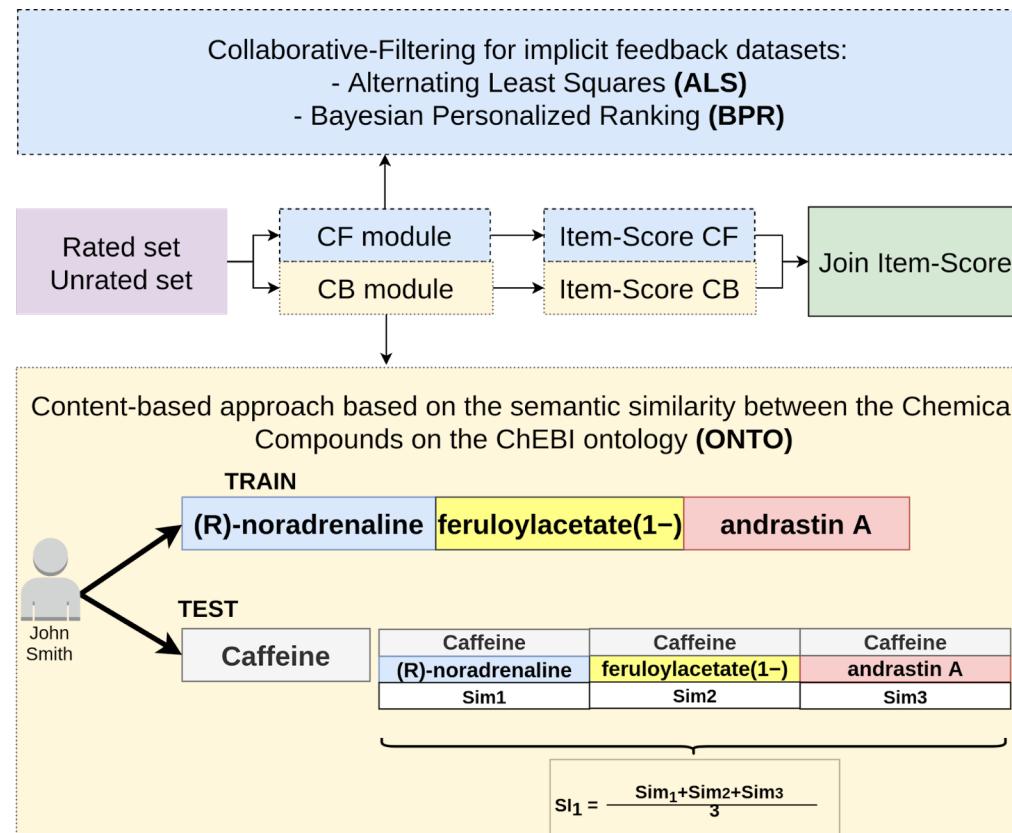

Application fields

Using ontologies from different fields in the NER phase, we improve the results for state-of-the-art collaborative-filtering recommender systems applied to the dataset created.
